Self-Maps of Projective Space

Abstract: For self maps of projective space over number elds and function elds, semi-stability implies minimality of the resultant. This is used to show the existence of a minimal presentation for these dynamical systems over number elds. It is analogous to the theory of curves when replacing the resultant with the discriminant. Furthermore it leads to the statement of a dynamical analog of Szpiro's conjecture, where we try to bound the degree of the resultant by the degree of conductor. However, when naively stated, this dynamical conjecture is false. I will talk about what may be done to create a viable conjecture.
